25 Seeds

1885B

Seed outdoors as soon as danger of frost has past in your area. Cover seed lightly with soil, 2 - 3 seeds together in groups. Space giants at least 3 m (10 ft) apart. For earlier Pumpkins start indoors 2 to 3 weeks in advance of intended date for moving the plants to the garden. Use Jiffy pots so the container and roots can be buried without disturbing the root system. Also make sure the pot is wet when transplanting. Sow 2 seeds per pot and do not thin. Germinates best at 22 C (72 F) in 7 to 10 days. Fertilize for the first 3 weeks with 10-52-17 formula. Pumpkins are ripe once the stem has reached a dark green color and is starting to wither. Ample water is needed for optimum size!

Please do not attempt to eat the seeds
as they have been treated

RUSSIAN GIANT
(95 Days)

500 Grams

2275

Sow seed in the garden in early spring, once the danger of frost is passed. Make sure the soil is well worked. Cover seed with about 1 cm (1/2 in) of soil. Sow 2 seeds per 30 cm (12 in) of row, after germination thin plants to 45 cm (18 in) apart. Ideal for a tall background screen. Attracts birds and the cured seed provides winter feed. Cut heads after florets have withered and hang to dry under cover. Fertilize every 2 weeks with 10-52-17 water soluble fertilizer. Garden spacing 45 cm (18 in) apart.
